

Astro Starter Kit: Minimal

```
bun create astro@latest
```

To update to the Astro 5.0 version you will have to execute the command:

```
bun install astro@beta
```

Seasoned astronaut? Delete this file. Have fun!

Project Structure

Inside of your Astro project, you'll see the following folders and files:

```
/
├── public/
├── src/
│   ├── pages/
│   │   └── index.astro
└── package.json
```

file:///h

Astro looks for `.astro` or `.md` files in the `src/pages/` directory. Each page is exposed as a route based on its file name.

There's nothing special about `src/components/`, but that's where we like to put any Astro/React/Vue/Svelte/Preact components.

Any static assets, like images, can be placed in the `public/` directory.

Commands

All commands are run from the root of the project, from a terminal:

| Command | Action |
|--------------------------|-----------------------|
| <code>bun install</code> | Installs dependencies |

| Command | Action |
|--------------------------------------|---|
| <code>bun run dev</code> | Starts local dev server at <code>localhost:4321</code> |
| <code>bun run build</code> | Build your production site to <code>./dist/</code> |
| <code>bun run preview</code> | Preview your build locally, before deploying |
| <code>bun run astro ...</code> | Run CLI commands like <code>astro add</code> , <code>astro check</code> |
| <code>bun run astro -- --help</code> | Get help using the Astro CLI |
